1/2/2025

Instructions to install the Aurora Streaming app on a firestick/cube device. The following assumes you have the firestick/cube connected to your Wi-Fi and updated to the latest operating software.

Step 1 - Turn on "Developer's Mode" on the firestick device

To activate device developer options:
> **Access the device "Settings."**
> **Select the "My Fire TV" option**
> **Choose "About."**
> **Select the Fire TV device and press the "Select" button on your remote seven(7) times.**

Once activated, the developer options are found in the "My Fire TV" section of the device. The Install Unknown App option requires a file manager app (Downloader) to be installed.

Step 2 - Download from the Amazon App Store, the app "Downloader" and install it.

Step 3 – Using "Downloader' (Browser option) download the Aurora Apk from http://tinyurl.com/aur800 (Latest version) or from "regez.net" . The version as of 11/2024 is **"AURORA-7.0-v911.apk". This is the Aurora app and you should have a selection on your main page after the install.**

Step 4 - Access URL "Aurora-Premium.com" Select "Account" and "Sign up". Follow instructions. The service has a family option and a full option (Extract) which includes adult programming. Select either.

You will have two(2) user/password pairs. One for the administration/billing options and one for the sign in of the Aurora app icon on the firestick/cube.

The Aurora app has an update option to update the Aurora to the latest APK which you should do after activating Aurora.

Note: As of 1/2025 Aurora allows you to access two(2) TVs with the same Aurora app user/password sign-on. You only need to set up the second firestick with the Aurora Apk. You DO NOT need to access the Aurora-Premium.com for any setup information.
