support@streamfirapp.tv
tme/streamfirepro

This documentation assumes you have Downloader installed and your Fire Stick is in developer mode. If not see documentation for Aurora Install. It also assumes you are familiar with the operation of a fire stick device.

Select Downloader and enter 2396773 (Streamfire V.1.2.2) in the downloader URL area and Select GO to download the apk (app). Downloader will download the apk and you will be presented with a Streamfire screen with a Cancel and Install option.

The option selection is difficult to see (at least on my screen), press the > key once and then the middle OK key. Streamfire will install and the DONE option is displayed. Press the OK key and the Downloader Status is displayed. You have the option to DELETE apk file you just downloaded to reclaim memory or the DONE option to exit by using the OK middle button.

If you use the DELETE option, you can press the back button two times to exit the Downloader screen that is displayed after the delete of the file. Move the round cursor to the right side of the Downloader screen.

Select the icon for Streamfire and move to your preferred location using the 3line key and the up/down/left/right/OK key pad.

Select the options in Streamfire for country options, channels and watchlist selections.
